About the Platform

This platform supports the full Teaching Assistant recruitment workflow, from publishing vacancies and submitting applications to reviewing candidates, managing workload rules, and tracking final decisions.

System Purpose

The TA Recruitment System is designed for a structured university recruitment process where students, Module Organisers, and Admin users work in one shared platform. It replaces scattered forms and manual communication with role-based dashboards, searchable tables, transparent status tracking, and consistent job and application management.

Role-Based Dashboards

The system provides separate dashboards for Students, Module Organisers, and Admin users. Each dashboard keeps the most important actions at the top of the page and opens operational pages directly below it, so users can move between profile, job, application, and management tasks without losing context.

Student Features

- Register and log in as a student
- View and update a detailed personal profile
- Browse and search TA vacancies
- Filter jobs by visible columns, deadline, and expiry status
- View job details and submit applications
- Track application status and workload warnings in My Applications

MO Features

- Register and log in as a Module Organiser
- Create, edit, close, re-open, delete, and view TA vacancies
- Review student applications for owned jobs
- View applicant profiles without leaving the review workflow
- Accept or reject applications and manage overtime exceptions
- Use AI candidate matching to compare applicants for a selected job

Admin Features

- Monitor all applications with summary statistics
- Filter applications by Pending, Accepted, and Rejected status
- Approve, reject, or withdraw application decisions when an override is needed
- Manage all job records across the system
- Search jobs and review vacancy visibility, quota, deadline, and hall display rules
- Edit, close, re-open, delete, and view job information

Smart Support

The platform includes AI-assisted features for recruitment decisions. Students can view AI match information and gap analysis when available, while Module Organisers can run AI candidate matching to receive match scores and evaluation reasons. These tools support decision-making, while final approval remains under human control.

System Value

The system improves TA recruitment by making vacancies easier to publish, applications easier to review, and decisions easier to trace. It reduces repetitive manual work, keeps workload and deadline rules visible, and gives each role a focused workspace for the tasks they perform most often. The result is a clearer, more transparent, and more maintainable recruitment process.

exsm - AI Skills Analysis

- **Logistics:** Campus preference matches (BUPT Main Campus), availability is fully aligned (all semester), but major (Intelligent Science & Technology) is not the preferred CS/SE — it's closely related but lacks explicit business management coursework or emphasis, creating a partial mismatch with the required Business Management skill.
- **Technical:** Strong alignment in programming (Java, Python, C/C++, web stack), systems-level work (HTTP server, concurrency, scheduling), and applied algorithm development; however, no evidence of Business Management domain knowledge (e.g., process modeling, requirements analysis, project lifecycle, UML, ERP concepts) — a hard requirement explicitly listed and unaddressed in skills or projects.
- **Mentoring:** No prior TA or formal mentoring experience reported; self-assessment acknowledges limited communication skills and frames mentoring intent as aspirational rather than demonstrated — insufficient evidence to support effective student guidance, especially for a module requiring explanation of both technical and business concepts.

AI Candidate Matcher

Powered by Qwen

C++ - Lab Assistant

Run AI Match

Candidate Name	Student ID	Major	Match Score	AI Evaluation Reason	Analysis
Li Hao	2023212133	Intelligent Science & Technology	72	- Logistics: Campus mismatch — candidate is restricted to BUPT Main Campus only, but role requires hybrid (likely involving remote or multi-campus coordination); major is Intelligent Science & Technology (not CS/SE), though closely related and coursework includes C++ and systems-relevant topics. - Technical: Partial match — explicitly claims 'Advanced C++ programming' and has C++ projects (HTTP server, task simulator) with concurrency, but no evidence of STL mastery, template metaprogramming, or Valgrind/memory leak debugging experience; core C++ course grade is only 82, and 'basic' multi-threading contradicts 'mastery' requirement. - Mentoring: No prior TA experience, self-identifies communication skills as needing improvement, and lacks documented student-facing teaching or mentoring — weak alignment with mentoring potential despite motivation and hands-on problem-solving emphasis.
